

CURRENT REFORMATIONS IN LEGISLATION TO DEVELOP THE HEALTH SYSTEM.

Musirmonova Adiba

Master's degree of Tashkent state university of Law

Annotation:

Health law in the human rights system; Theoretical and legal analysis The formation of a modern system of medical care for the population, the creation of a system of primary health care through the establishment of rural medical centers, urban and rural family clinics, including the development of proposals and recommendations for the provision of high-tech medical care in the field.

Keywords: person, health, state, law, appeals, health insurance medical care, decree, decision, law, privilege, covid-19.

Introduction.

Law is a system of approved general mandatory norms established by the state. The right includes the fundamental rights of citizens to be guaranteed and protected by the state. Human rights are a priority in every state, health insurance, access to medical services. As one of the founders of world medicine, the great scholar Abu Ali ibn Sina, said, our people are a great example of goodness and nobility. He sees honorable professionals who mobilize their knowledge and experience, talents and skills in the field of public health, and always appreciates your hard work. Indeed, human health is a priceless asset of society, and doctors are the selfless guardians of this wealth.

In our country, the health care system plays a priority role in ensuring human rights and legitimate interests, glorifying their dignity. Therefore, I think it is appropriate to reiterate the idea that if we achieve peace and health in our country, we will

achieve everything else. It should be noted that the concept of development of the health care system in 2025 has been adopted. Most importantly, medical institutions are getting closer to the people. The quality of medical services is improving, new modern trends, methods of treatment and diagnostics, unique scientific and practical experiments are being formed. This can be seen in the fact that in a short period of time more than 700 complex operations on kidney, liver and stem cells have been successfully performed. The scope of work on the protection of motherhood and childhood is also expanding. In particular, the establishment of a system of continuous monitoring of the health of pregnant women is an important factor in significantly reducing maternal and infant mortality. is always in the center of our attention. Proof of this can be seen in the work we do to improve their working and living conditions, provide them with modern housing, increase their financial interest. Our main task is to transform the medical sector into a highly efficient, truly popular system. Particular attention will be paid to medical prevention through the primary link of care, increasing the role of family physicians. In particular, early detection of diseases that are the most common and the leading cause of early death among the population, targeted screening activities, free provision of special prophylactic drugs and promotion of healthy lifestyles,

Discussion.

We are all well aware that only a healthy people, a healthy nation will be able to build the great goal we have set for ourselves - a new Uzbekistan. I believe that you, dear people, who have always been a cure for the problems of our country, will work tirelessly to achieve such high goals. Being is a high example of goodness and nobility. Abu Ali ibn Sina has several books on medicine, such as Abu Ali ibn Sina's "Laws of Medicine" ("Al Qanun fittib"), which has long been a major guide in world medicine. In particular, Abu Ali Ibn Sina was very famous in his time as a physician (judge) who used new methods of treatment. Abu Rayhan Beruni's "Medicine in Medicine" ("Kitab assaydana fittib") is a work by Eastern thinkers who created

world-famous works in the field of medicine. How many changes have taken place, special hospitals will be opened in Samarkand, where the earth is beautiful?

Health is a social, economic medical system based on the protection of human health, the main task of health is to prevent, treat, ensure a healthy life and longevity, and to provide patients with modern specialized appropriate care. After the independence of Uzbekistan, the reform of public health began. The main principle of the health care system is to restore and develop modern and effective methods of prevention. Reorganization of training to meet the needs of the times and society has created an industry in the country that produces high-quality and sufficient quantities of medicines, medical supplies and related equipment. The main task was to further improve the material and technical base of health care facilities, to privatize some of the treatment and prevention facilities, and to change the form of ownership. A network of specialized medical care facilities for children was established. On May 7, 1993, the Republic of Uzbekistan The Order of "For a Healthy Generation" of the I and II degrees was established. In the first phase (1991-1994), the focus was on improving maternal and child health services, stabilizing demographics, and reducing communicable diseases. As a result, hospitalization decreased from 18.3% in 1997 to 13.8% in 2001.

Results and conclusion.

A new era in the development of health care began in 1998 - on November 10, 1998 by the Decree of the President of the Republic of Uzbekistan in 1998-2005. The State Program on Reconstruction of the Storage System was adopted. It outlined measures to improve the quality of medical care for the population. Under this program, measures have been taken to strengthen the primary health care system and to develop general practice. A new form of emergency medical care has been introduced. As a result, the provision of emergency medical care in all regions of the country, the provision of qualified medical care by calling a doctor at home. The

main directions of development of maternal and child health services (2000), Mother and Child (2001), and Additional Measures to Improve the Health of Women and the Generation (2002). Medical screening of women of childbearing age for the detection and treatment of extragenital diseases has been intensified, contraceptive services have been increased, the consequences of early and close marriages among the population, especially among young people, and pregnancy in women with extragenital diseases and awareness-raising on birth prevention has been intensified. In order to prevent the birth of children with congenital defects and inherited diseases, a system of screening of mothers and children has been established, and work is underway to establish the State Register of Genetics.
